

NUS6160MN

Low Profile Overvoltage Protection IC with Integrated MOSFET

This device represents a new level of safety and integration by combining an overvoltage protection circuit (OVP) with a dual 20 V P-channel power MOSFET. The OVP is specifically designed to protect sensitive electronic circuitry from overvoltage transients and power supply faults. During such events, the IC quickly disconnects the input supply from the load, thus protecting it. The integration of the additional transistor and power MOSFET reduces layout space and promotes better charging performance.

The IC is optimized for applications that use an external AC-DC adapter or a car accessory charger to power a portable product or recharge its internal batteries.

Features

- Overvoltage Turn-Off Time of Less Than 1.5 μ s
- Undervoltage Lockout Protection; 3.0 V, Nominal
- High Accuracy Undervoltage Threshold of 5.0%
- -20 V Integrated P-Channel Power MOSFET
- Low $R_{DS(on)}$ = 64 m Ω @ -4.5 V
- Compact 3.0 x 4.0 mm QFN Package
- Maximum Solder Reflow Temperature @ 260°C
- This is a Pb-Free Device

Benefits

- Provide Battery Protection
- Integrated Solution Offers Cost and Space Savings
- Integrated Solution Improves System Reliability
- Optimized for Commercial PMUs from Top Suppliers

Applications

- Portable Computers and PDAs
- Cell Phones and Handheld Products
- Digital Cameras

PIN DESCRIPTION

Pin	Name	Description
1	Out	This pin is the output of the internal OVP chip. It must be connected to the source of the upper FET (Pin 8).
3	Gate FET _{SW}	This pin is the gate of the upper FET which is normally used for a switch in series with the battery. It is controlled by the PMU.
4, 5, 6, 7	Drain FET _{SW}	These pins are the drain of the upper FET. For the lowest on resistance connect all pins together. This set of pins must be connected to the source of the lower (regulator) FET, Pin 10.
8	Source FET _{SW}	This pin is the source of the upper FET and must be connected to the output pin of the internal OVP chip (Pin 1).
9, 11, 13	Drain FET _{REG}	These pins are the drain of the lower FET which is normally used for the regulation function. It connects to the positive terminal of the battery.
10	Source FET _{REG}	This pin is the source of the lower FET and must be connected to the drain pins of the upper FET.
12	N/C	This pin has no internal connections and is isolated from all internal circuitry within the chip.
14	Gate FET _{REG}	This pin is the gate of the lower FET which is normally used for the regulation function in series with the battery. It is controlled by the PMU.
15	FLAG	The fault flag is an open drain output and therefore requires a pullup resistor. The FLAG pin will be driven low when the input voltage exceeds the OVLO trip level.
2, 16, 17, 21, 22	N/C	These pins are connected to the ground of the analog chip. This is a medium impedance connection and should not be used for the ground signal. These pins should either be left floating or connected to ground, but not any other potential. If these pins are connected to ground, the ground pin (19) must still be used.
18	EN	The ENABLE pin must be held low for normal operation. When this pin is tied high the unit will be shut down. The state of the enable pin has no impact on the FAULT pin.
19	Gnd	This is the ground reference pin for the internal OVP chip.
20	In	This pin is the input to the internal OVP chip and connects to the wall, or car adaptor.

Operational Description

The NUS6160 provides overvoltage protection for positive voltages up to 20 V. A P-Channel FET protects the load connected on the Vout pin, against positive overvoltage conditions. The Output follows the VBUS level until OVLO threshold is reached.

Undervoltage Lockout (UVLO)

To ensure proper operation under all conditions, the device has a built-in undervoltage lock out (UVLO) circuit. As the input ramps from 0 V, the output remains disconnected from input until the Vin voltage is above 3.2 V nominal. The FLAG output is pulled to low as long as Vin does not reach the UVLO threshold. This circuit incorporates hysteresis on the UVLO pin to provide noise immunity to transient condition.

Figure 28. Output Characteristic vs. Vin

Overvoltage Lockout (OVLO)

To protect connected systems on Vout Pin from overvoltage, the device has a built-in overvoltage lock out (OVLO) circuit. During an overvoltage condition, the output remains disabled until the input voltage is reduced to below the OVLO hysteresis level. The FLAG output is tied to low until Vin is higher than OVLO. This circuit incorporates hysteresis on the OVLO pin to provide noise immunity from transient conditions.

FLAG Output

The NUS6160 provides a FLAG output, which alerts external systems that a fault has occurred. This pin goes low as soon as the OVLO threshold is exceeded. When Vin level recovers to its normal range the FLAG is set high.

The FLAG Pin is an open drain output, thus a pullup resistor (typically 1 MΩ – Minimum 10 kΩ) must be provided to Vbattery.

EN Input

To enable normal operation, the EN pin shall be forced low or connected to ground. A high level on the pin disconnects the OUT Pin from IN Pin. EN does not override an OVLO or UVLO fault.

Internal PMOS FET

The NUS6160 includes an internal PMOS FET which connects the input to the output pin. This FET is turned off

in the event of an overvoltage condition to protect the output from a positive overvoltage condition. The low Rds(on), during normal operation will minimize the voltage drop across the device. (See Figure 16).

ESD Tests

The NUS6160 meets the requirements of the IEC61000-4-2, level 4 (Input pin, 1 μF mounted on board). For the air discharge condition, Vin is protected up to ± 15 kV. In the contact condition, Vin is protected up to ±8 kV ESD. Please refer to Figure 29 to see the IEC 61000-4-2 electrostatic discharge waveform.

Figure 29. IEC 61000-4-2 Curve

Thermal Impedance

Due to cross heating of the three dice in the package, the equivalent thetas are given for this device rather than the individual thetas. To calculate the junction temperatures of a single die, the total power must be used. For example, given the following parameters, the die temperatures will be as shown:

- I_{dc} = 500 mA
- R_{DS(on) OVP} = 305 mΩ
- R_{DS(on) FETsw} = 72 mΩ
- FET_{reg} has a 1.0 V Drop
- Board copper area = 161 mm²

Calculate the individual power dissipations:

$$P_{OVP} = (0.50 \text{ A})^2 \times .305 \Omega = 0.076 \text{ W}$$

$$P_{SW} = (0.50 \text{ A})^2 \times .072 \Omega = 0.018 \text{ W}$$

$$P_{REG} = 0.50 \text{ A} \times 1.0 \text{ V} = 0.50 \text{ W}$$

$$P_{TOT} = 0.076 + 0.018 + 0.50 = 0.594 \text{ W}$$

From the Maximum ratings table for thetas, 161 mm² and 1 V drop across FET_{REG}:

- OVP FET 53°C/W
- FET_{SW} 49°C/W
- FET_{REG} 92°C/W

The die temperature rises above ambient are:

$$T_{OVP} = 53^\circ\text{C/W} \times 0.594 \text{ W} = 32^\circ\text{C}$$

$$T_{SW} = 49^\circ\text{C/W} \times 0.594 \text{ W} = 29^\circ\text{C}$$

$$T_{REG} = 92^\circ\text{C/W} \times 0.594 \text{ W} = 55^\circ\text{C}$$
